

CS120: Computer Networks

Lecture 16. TCP 2

Zhice Yang

Transmission Control Protocol (TCP)

- RFC: 793,1122,1323, 2018, 2581
- Goal: Reliable, In-order Delivery
 - Connection oriented
 - Flow control
 - Congestion control
- ➤ Core Algorithm: Sliding Window

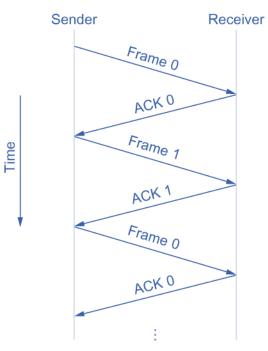

Delay × Bandwidth

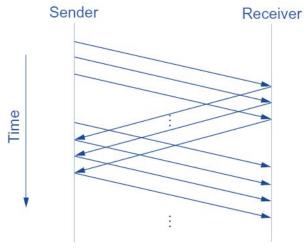

Quantify the utilization of the link

Link type	Bandwidth (typical)	One-way distance (typical)	Round-trip delay	RTT × Bandwidth
Dial-up	56 kbps	10 km	87 μs	5 bits
Wireless LAN	54 Mbps	50 m	0.33 μs	18 bits
Satellite	45 Mbps	35,000 km	230 ms	10 Mb
Cross-country fiber	10 Gbps	4,000 km	40 ms	400 Mb

Delay × Bandwidth

- Efficiency Problem
 - 1.5Mbps bandwidth
 - 45ms RTT
 - 1KB per packet
 - Effective Rate = 1024*8/(1024*8/1.5M+45ms)=162kbps
- Solution
 - Pipeline
 - Full pipe
 - 1.5Mbps*45ms/1kB = 8 packets

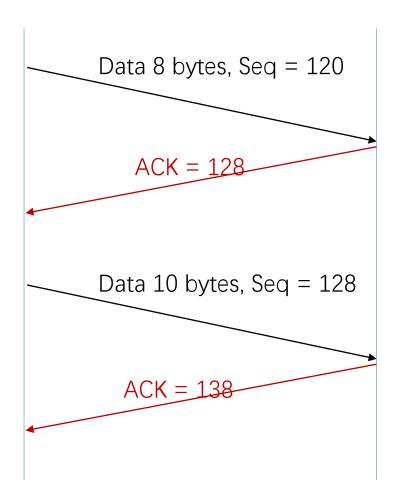

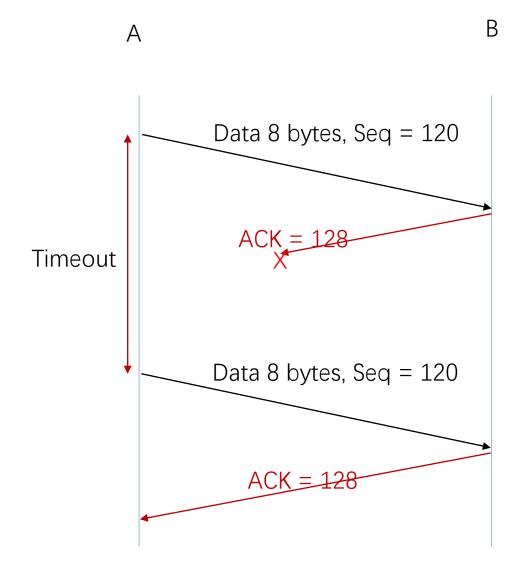

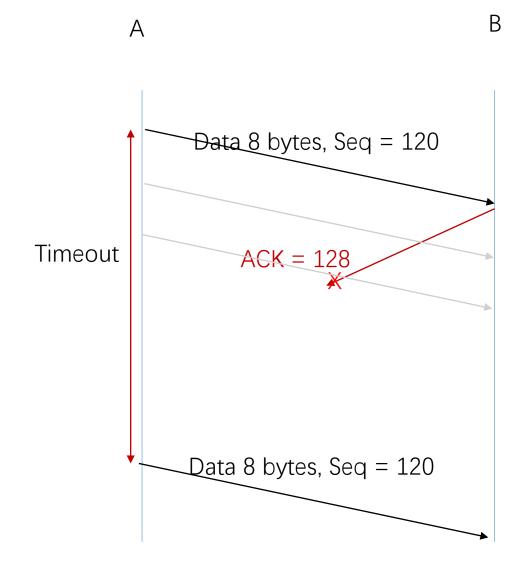

Sliding Window

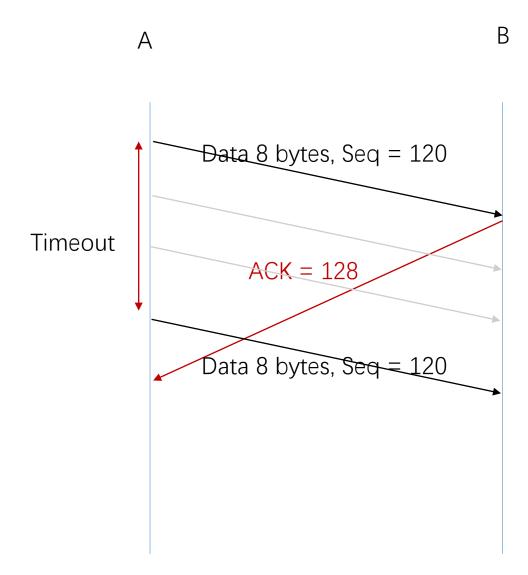

- Sender Buffer
 - Retransmit
- Receiver Buffer
 - Frame order

АВ

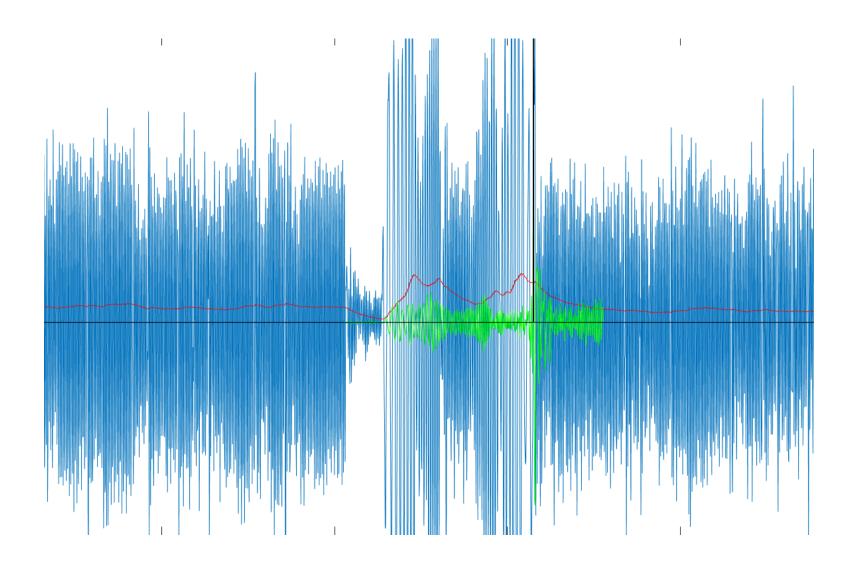

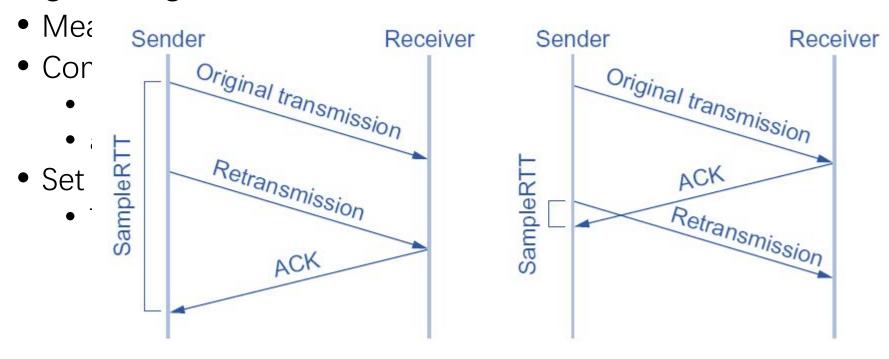

- Original Algorithm
 - Measure SampleRTT for each segment/ ACK pair
 - Compute weighted average of RTT
 - EstimatedRTT = a * EstimatedRTT + (1 a)* SampleRTT
 - a is between 0.8 and 0.9
 - Set timeout based on EstimatedRTT
 - TimeOut = 2 * EstimatedRTT

Original Algorithm

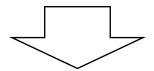

- Karn/Partridge Algorithm
 - Do not sample RTT when retransmitting
- Its RTT estimation is not accurate
 - RTT is a critical signal for identifying network congestion

- Jacobson/Karels Algorithm
 - Take RTT variance into account

```
Difference = SampleRTT - EstimatedRTT
EstimatedRTT = EstimatedRTT + (\delta*Difference)
Deviation = Deviation + \delta*(|Difference| - Deviation)
TimeOut = \mu* EstimatedRTT + \phi* Deviation
```

Jacobson/Karels Algorithm Implementation

```
Difference = SampleRTT - EstimatedRTT
EstimatedRTT = EstimatedRTT + (\delta*Difference)
Deviation = Deviation + \delta*(|Difference| - Deviation)
TimeOut = \mu* EstimatedRTT + \phi* Deviation
```

Transmission Control Protocol (TCP)

- RFC: 793,1122,1323, 2018, 2581
- Goal: Reliable, In-order Delivery
 - Connection oriented
 - > Flow control
 - Congestion control
- ➤ Core Algorithm: Sliding Window

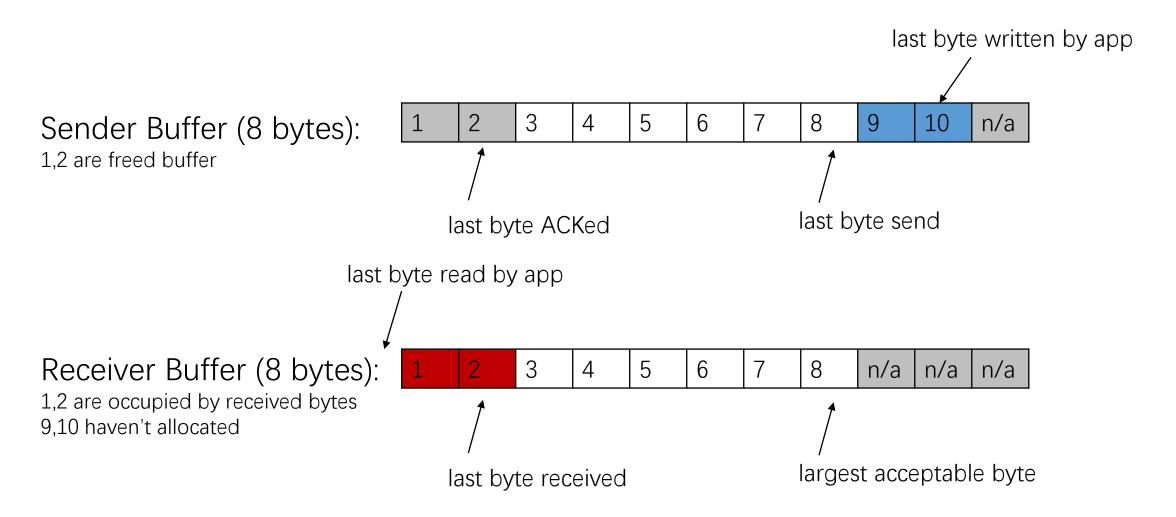

- Goal:
 - Sender does not overrun receiver's buffer
- Approach:
 - Receiver's window is not fixed, determined by the free buffer size
 - The receiver advertises an adjustable window size (AdvertisedWindow field in TCP header)
 - Sender is limited to having no more than AdvertisedWindow bytes of unACKed data at any time

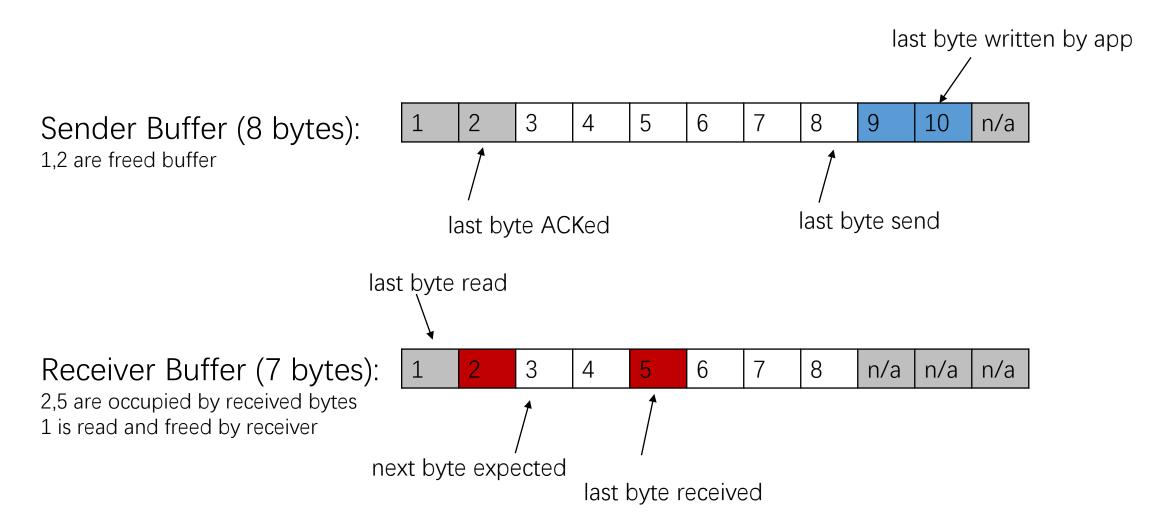

Sliding Window

SWS send window size 3 6 8 10 Sender Buffer: LFS LAR last frame send last ACK received RWS receive window size Receiver Buffer: 3 6 10 5 8 LAF LFR largest acceptable frame last frame received

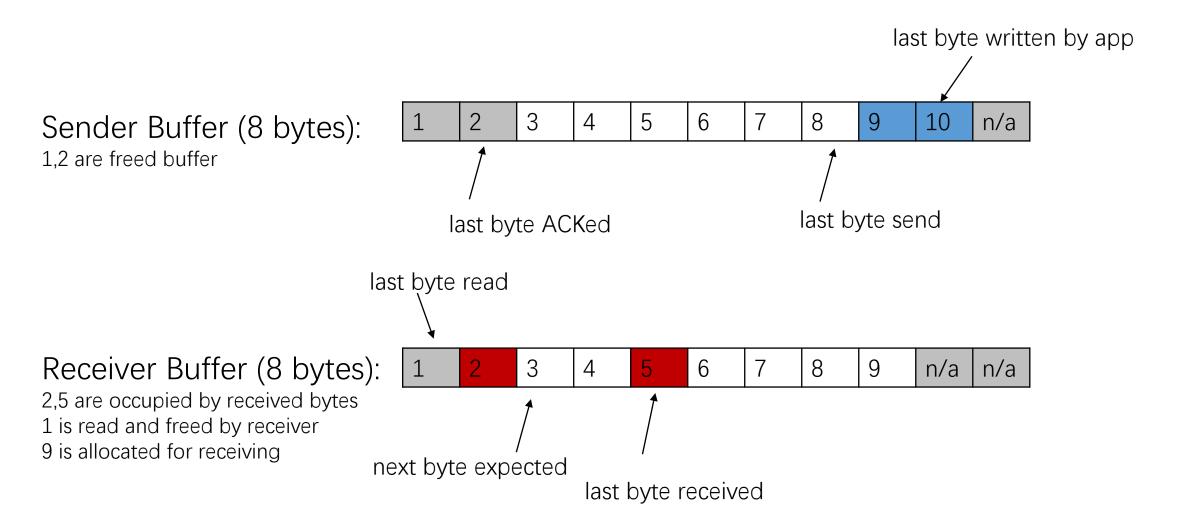

Sliding Window in TCP

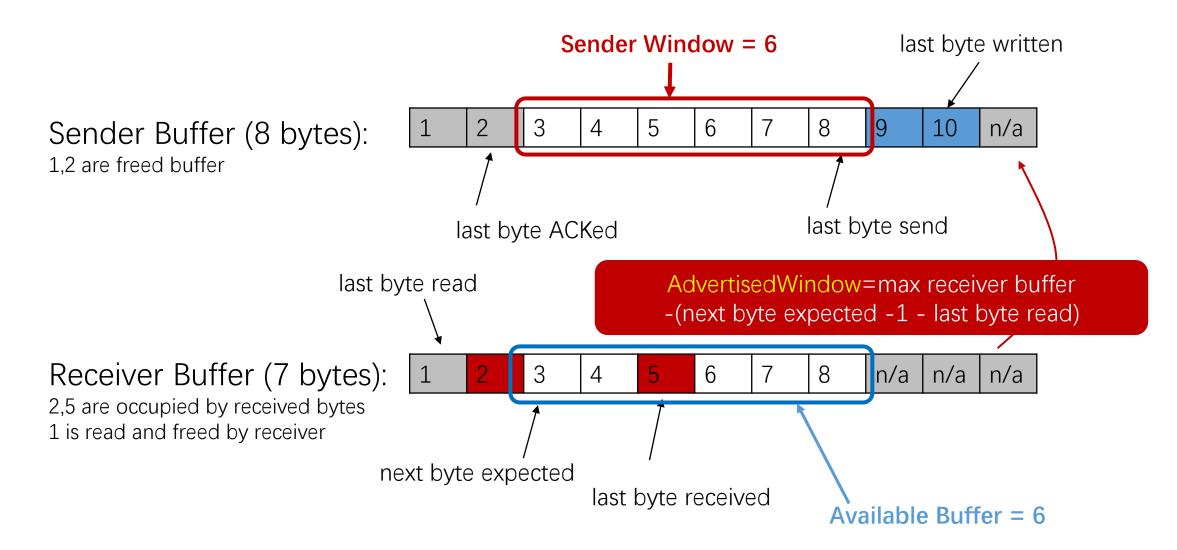

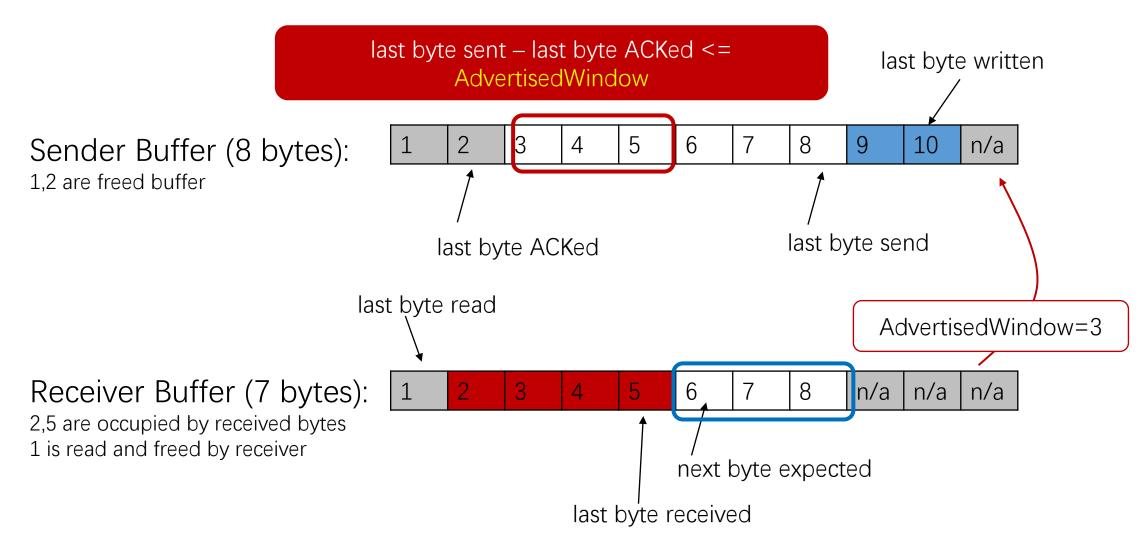

Sliding Window in TCP

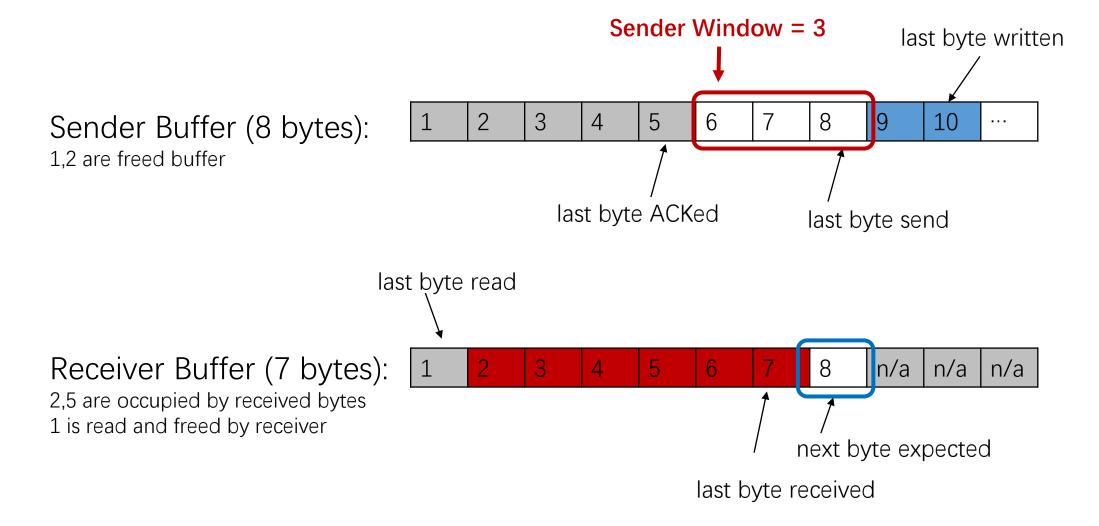

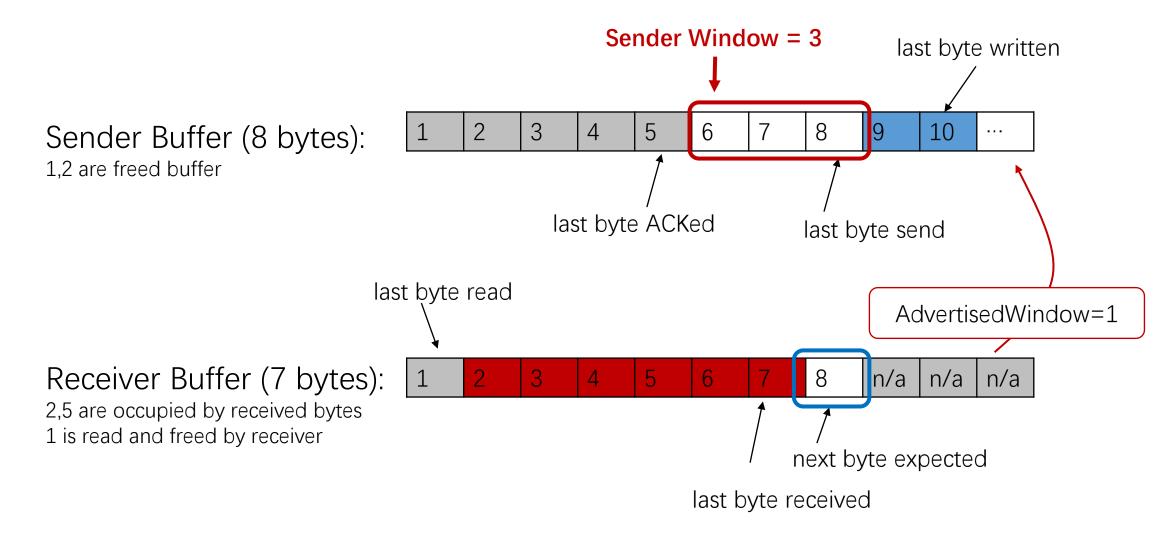

Sliding Window in TCP

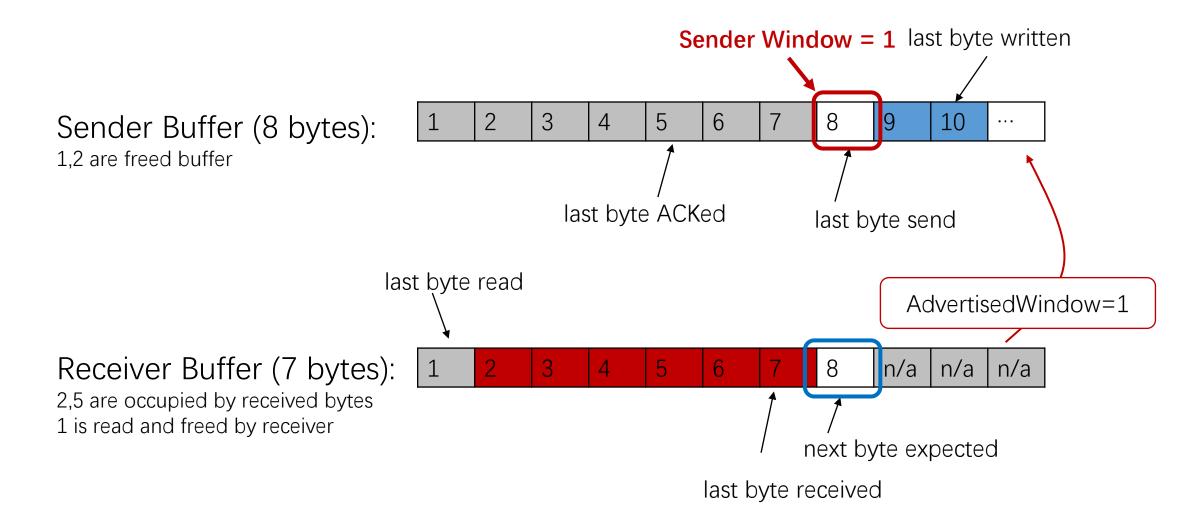

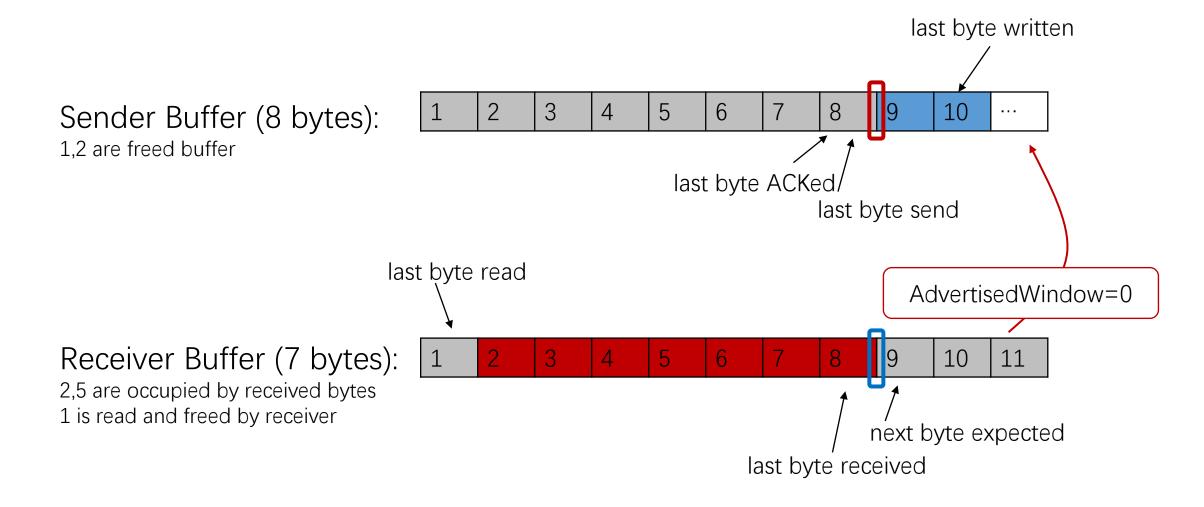

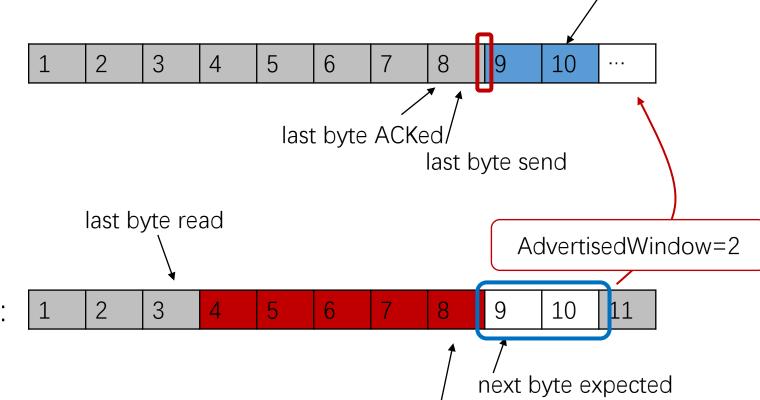

last byte written

TCP Flow Control

Sender Buffer (8 bytes): 1.2 are freed buffer

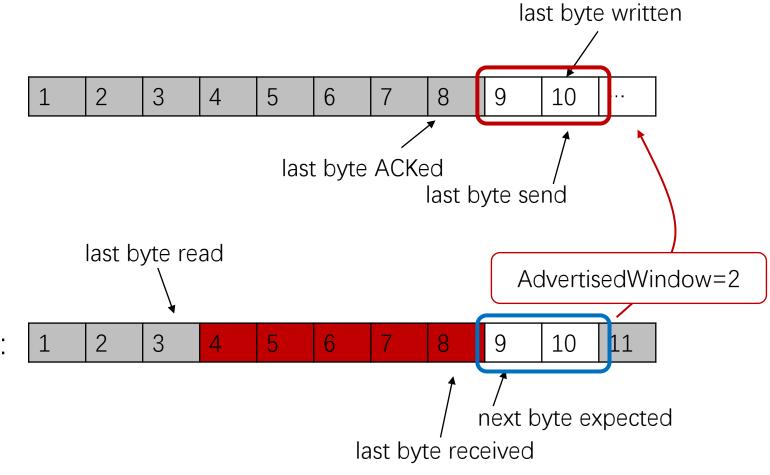

last byte received

Receiver Buffer (7 bytes):

2,5 are occupied by received bytes 1 is read and freed by receiver

Sender Buffer (8 bytes):

1,2 are freed buffer

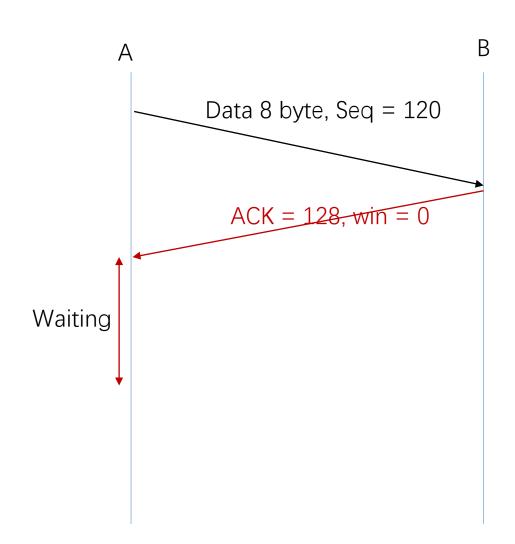

Receiver Buffer (7 bytes):

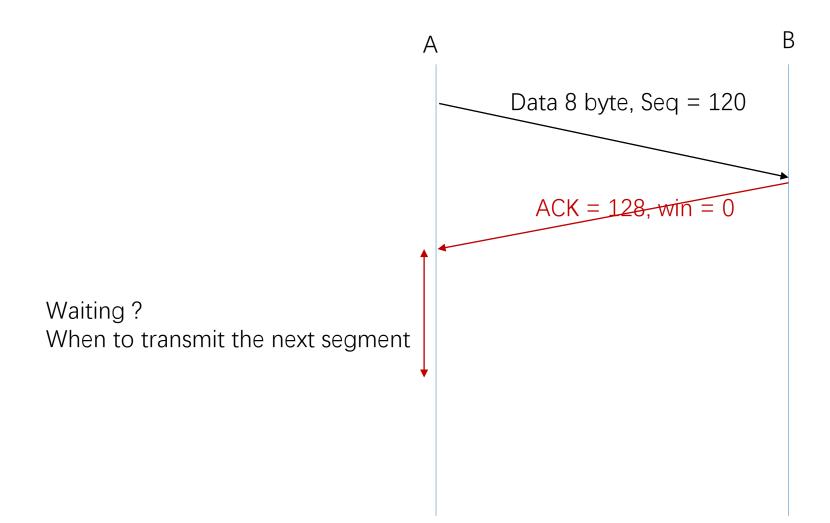

2,5 are occupied by received bytes 1 is read and freed by receiver

- Receiver throttles sender by advertising a window size no larger than the amount it can buffer:
 - AdvertisedWindow=max receiver buffer-(next byte expected -1 last byte read)
 - Indicate the amount of free space available in the receive buffer
- Sender must adhere to AdvertisedWindow from the receiver such that:
 - last byte sent last byte ACKed <= AdvertisedWindow

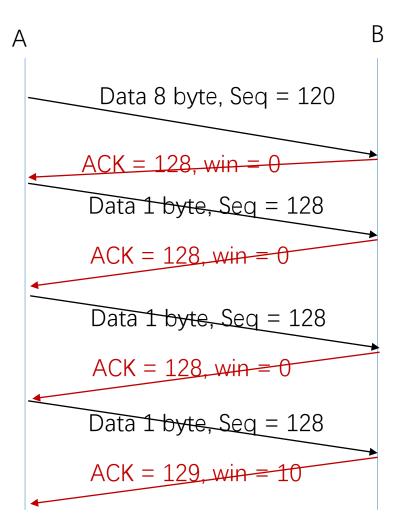

TCP Flow Control: 0 window case

TCP Flow Control: 0 window case

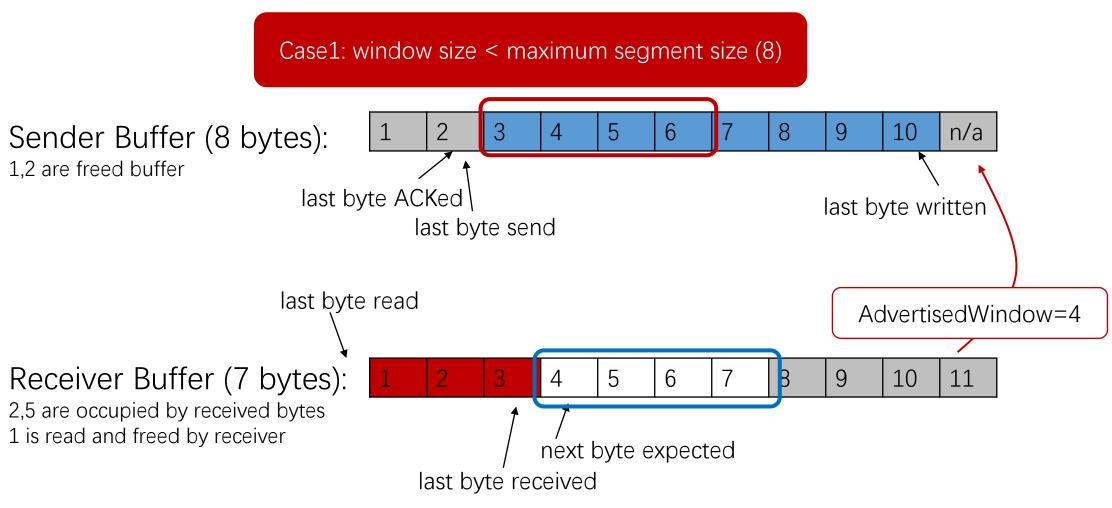

TCP Flow Control: 0 window case

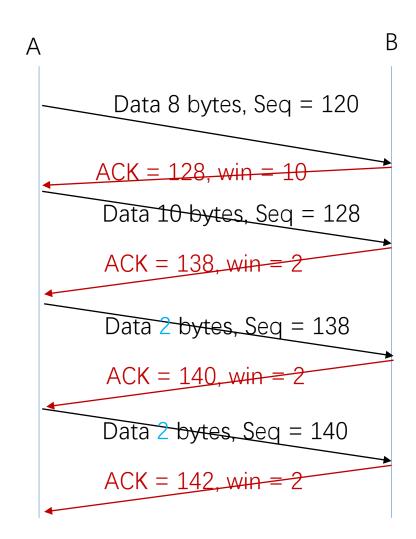

Send 1 byte segment to probe

TCP Flow Control: Silly Window Syndrome

TCP Flow Control: Silly Window Syndrome

TCP Flow Control: Silly Window Syndrome

Case2: available data < maximum segment size (8) 6 9 10 n/a Sender Buffer (8 bytes): 3 8 1,2 are freed buffer last byte ACKed\ last byte send last byte written last byte read AdvertisedWindow=7 Receiver Buffer (7 bytes): 9 2 3 6 8 10 2,5 are occupied by received bytes 1 is read and freed by receiver next byte expected last byte received

TCP: How to Pack a Segment

- Best of Effort
 - Silly Window Syndrome
- Wait Until Full
 - Less Timely
- Hybrid
 - Wait Until Full + Timer

TCP: Nagle's Algorithm

When the application produces data to send if both the available data and the window \geq MSS send a full segment else if there is unACKed data in flight buffer the new data until an ACK arrives else send all the new data now

Transmission Control Protocol (TCP)

- RFC: 793,1122,1323, 2018, 2581 ➤ TCP patches
- Goal: Reliable, In-order Delivery
 - Connection oriented
 - Flow control
 - Congestion control
- Core Algorithm: Sliding Window

TCP Record Boundaries

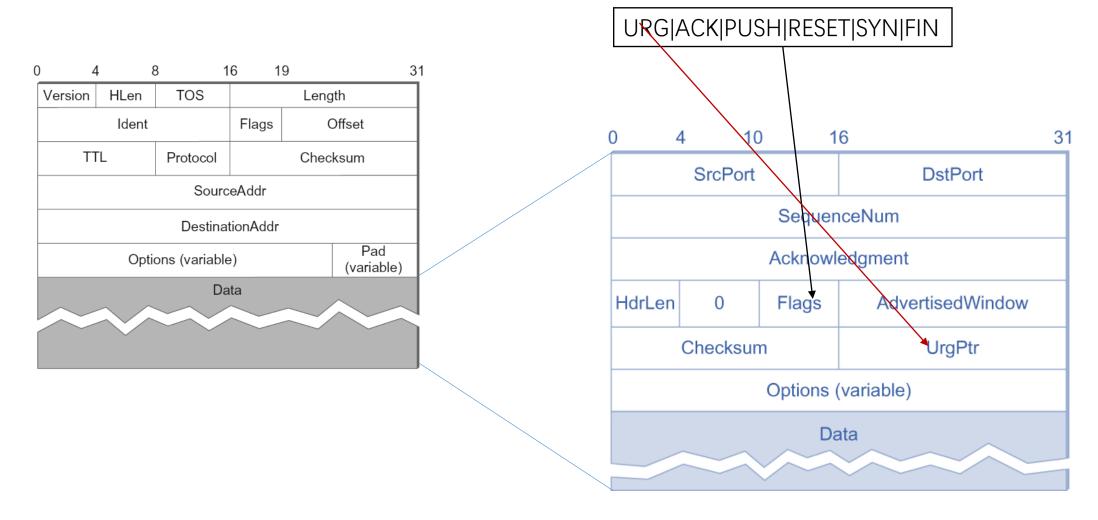

- Problem: TCP is a byte stream, how to specify a message in the stream
 - UDP: one message per frame

Tx: 10 2 2 Rx: 7 7

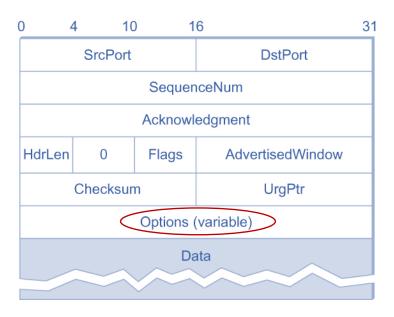

- Solution
 - Sentinel-based Checking
 - URG flag
 - PUSH flag

TCP will inform the application that a URG/PUSH segment is received

TCP: Header

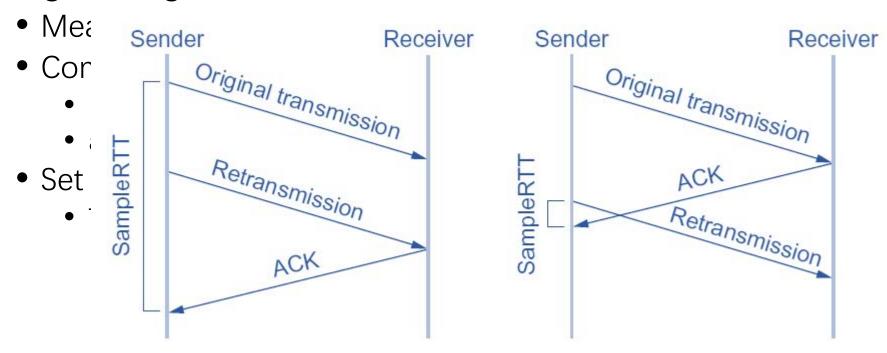

• TCP keeps evolving to incorporate high performance network

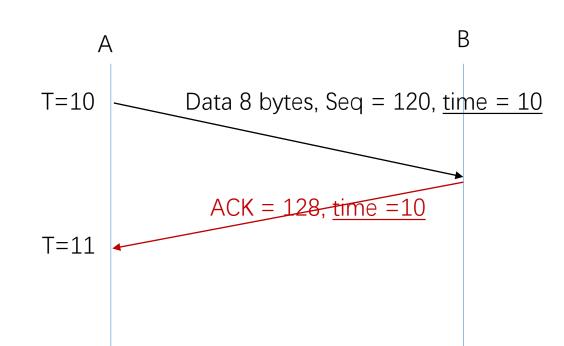

Sliding Window in TCP: Adaptive Timeout

Original Algorithm

- Better Estimation of RTT
 - Introduce 32-bit timestamp

- Sequence Number Wraparound: sequence number can be easily used up in high speed network (too many bytes are out per unit time)
 - Use Seq + Timestamp to identify wraparound

Table 5.1 Time Until 32-Bit Sequence Number Space Wraps Around	
Bandwidth	Time until Wraparound
T1 (1.5 Mbps)	6.4 hours
Ethernet (10 Mbps)	57 minutes
T3 (45 Mbps)	13 minutes
Fast Ethernet (100 Mbps)	6 minutes
OC-3 (155 Mbps)	4 minutes
OC-12 (622 Mbps)	55 seconds
OC-48 (2.5 Gbps)	14 seconds

- Keeping the Pip Full: Advertised Window is not large enough for the Rx buffer
 - Advertised Window (16bits) + Scaling Factor (0 to 14)
 - Negotiated in SYN packet

Table 5.2 Required Window Size for 100-ms RTT	
Bandwidth	${\sf Delay} \times {\sf BandwidthProduct}$
T1 (1.5 Mbps)	18 KB
Ethernet (10 Mbps)	122 KB
T3 (45 Mbps)	549 KB
Fast Ethernet (100 Mbps)	1.2 MB
OC-3 (155 Mbps)	1.8 MB
OC-12 (622 Mbps)	7.4 MB
OC-48 (2.5 Gbps)	29.6 MB

Selective ACK

Demo

- TCP Handshake
 - filter: tcp.stream eq X
- TCP Sliding Window
- TCP Extensions
